

CLOUD BRIDGE **AWS** **WELL-ARCHITECTED** DESIGN

Unlock The Potential Of Your On-Premise Infrastructure by moving to the cloud.

Cloud Bridge AWS Well-Architected Design is a consultative service designed to offer infrastructure designs of what your workloads would look like in AWS.

How does it work?

Step 1

Our cloud architects evaluate your current infrastructure using the **AWS Well-Architected Tool**.

Step 2

We compile a report highlighting wellarchitected areas, where there's room for improvement and produce a design including costs of a potential new AWS environment.

Step 3

AWS fund us to produce these high level designs up to the value of \$5000. We can use these funds to offset the consultancy design costs in carrying out the work.

The 6 Pillars of the AWS Well-Architected Framework

Our Certified Architects will evaluate your infrastructure using these 6 Pillars:

What are the benefits?

AWS Best Practice

Cloud Bridge is a certified AWS Well-Architected Partner. This means our design process is based on the Well-Architected Framework. You can trust our cloud architects to use only best practice methods. This will save you from the costly errors that might occur when using an uncertified partner or carrying out the work yourself.

Helps Your Organisation

Modern organisations simply cannot afford any issues with the cloud. Strong infrastructure keeps organisations productivity stable, costs controlled and risk low. Cloud Bridge AWS Well-Architected Designs are the best way to achieve this. Our architects will look for any problems related to security, reliability, performance and cost. Because they are certified, they know exactly what problems to look for and how to re-design them to mitigate them.

Saves You Time, Money & Stress

The Well Architected design are fully funded by AWS covering \$5000 worth of design consultancy costs. You will receive a complete overview of the potential design and costs for running your on premise workload in AWS, with the peace of mind that it has been designed under the AWS certified well architected framework.
