Agentic AI: From Cloud Control to AI Value

Most organisations struggle to control cloud cost and usage because they lack visibility and governance. Once that foundation is in place, AI becomes much easier to adopt, scale, and deliver value from.

Cloud Bridge provides a structured, fundable pathway to move from first use case to enterprise-scale AI - with control, governance, and measurable outcomes at every stage.

Why Agentic AI

Faster time to value

Launch production-grade use cases in as little as 5-7 weeks.

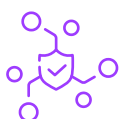

Built to scale

Standardise once, then extend across teams and workflows.

Lower delivery risk

Start with proven patterns – not over-engineered platforms.

Business-led outcomes

Focus on measurable improvements in speed, quality, and cost.

No “big bang” rebuild required

Deliver value without needing to rebuild your entire data estate upfront.

Cost and governance from day one

FinOps, security, and guardrails embedded – not bolted on later.

Why governance comes first

Before scaling AI, organisations need:

- Visibility into cost and usage
- Clear ownership and controls
- Governance and guardrails in place

Once established, AI can be deployed quickly and scaled safely.

CRAWL: PROVE VALUE

Use Agentic AI to solve one specific, high-value challenge. This stage is focused on: clear KPI, clear owner, clear outcome.

- Pick one high-value use case and resolve one problem
- Apply proven AI patterns with security and cost guardrails built in
- Integrate, launch, and measure impact quickly

Outcome: Proven value + clear roadmap to scale.

Funding support available: Up to \$50K.

WALK: SCALE USE CASES

Once value is proven, replicate the pattern across similar workflows and teams.

- Standardise governance, evaluation, and cost controls
- Reuse proven patterns, components, and guardrails
- Extend safely across teams and business units

Outcome: Multiple use cases, reduced cost per deployment.

Funding support available: Up to \$100K.

RUN: ENTERPRISE AI

At scale, specialised agents are coordinated through a central orchestration layer.

- Operate with central policy, monitoring, audit trails, and cost control
- Connect specialised agents into one coordinated ecosystem
- Provide a unified AI interface across the organisation

Outcome: AI embedded as an enterprise capability.

Total funding advantage: Up to \$150k to offset Cloud Bridge consultancy costs.

Cost & Governance Built In From Day One FinOps for AI

Predictable, controlled spend: define unit costs, set budgets/thresholds, and optimise usage with model routing and prompt efficiency - so you can scale without surprises.

Security & Governance
Compliant, audit-ready by design: least-privilege access, data protection controls, and audit-ready logging are built in, with guardrails for sensitive data and safe scaling.

Key takeaways

- Start narrow to prove value quickly - with cost and risk controlled from day one.
- Scale with governance and cost guardrails, not chaos.
- Treat Agentic AI as an operating capability, not a one-off pilot.
- **Move from AI experimentation → funded programme → enterprise capability.**

Take the next step

Once you have control, we'll help you identify your best first AI use case and map a practical 90-day path from pilot to scalable value - including a cost model, security approach, and governance controls required to deploy safely.
